19–2 Viruses what Is a Virus?

What Is a Virus?

Viruses are particles of nucleic acid, protein, and in some cases, lipids.

Viruses can reproduce only by infecting living cells.

Copyright Pearson Prentice Hall

Slide 2 of 34 Viruses differ widely in terms of size and structure.

All viruses enter living cells and use the infected cell to produce more viruses.

Slide 3 of 34 **19–2 Viruses** What Is a Virus?

19–2 Viruses What Is a Virus?

A typical virus is composed of a core of DNA or RNA surrounded by a protein coat.

A capsid is the virus's protein coat.

Copyright Pearson Prentice Hall

Slide 5 of 34 Capsid proteins bind to receptors on the cell surface and "trick" the cell into allowing it inside.

Once inside, viral genes are expressed and the cell transcribes and translates them into viral capsid proteins.

The host cell may makes copies of the virus, and be destroyed.

Slide 6 of 34 19–2 Viruses What Is a Virus?

Most viruses are highly specific to the cells they infect.

Viruses that infect bacteria are called **bacteriophages.**

Slide 7 of 34

Viral Infection

Once the virus is inside the host cell, two different processes may occur.

• Some viruses replicate immediately, killing the host cell.

Slide 8 of 34

• Others replicate, but do not kill the host cell immediately.

19–2 Viruses Viral Infection

Lytic Infection

In a lytic infection, a virus enters a cell, makes copies of itself, and causes the cell to burst.

Slide 10 of 34

Copyright Pearson Prentice Hall

Bacteriophage takes over bacterium's metabolism, causing synthesis of new bacteriophage proteins and nucleic acids.

Slide 11 of 34

nucleic acids assemble into complete bacteriophage particles.

Copyright Pearson Prentice Hall

Slide 12 of 34 **19–2 Viruses** Viral Infection

Bacteriophage enzyme lyses the bacterium's cell wall, releasing new bacteriophage particles that can attack other cells.

Slide 13 of 34

19–2 Viruses Wiral Infection

Lysogenic Infection

Other viruses cause **lysogenic infections** in which a host cell makes copies of the virus indefinitely.

In a lysogenic infection, a virus integrates its DNA into the DNA of the host cell, and the viral genetic information replicates along with the host cell's DNA.

> Slide 14 of 34

Lysogenic Infection Prophage

Bacteriophage DNA inserts itself into bacterial chromosome.

Copyright Pearson Prentice Hall

Slide 15 of 34

Lysogenic Infection Prophage

Bacteriophage DNA (prophage) may replicate with bacterium for many generations.

Copyright Pearson Prentice Hall

Slide 16 of 34

Bacteriophage DNA (prophage) can exit the bacterial chromosome. Bacteriophage enters lytic cycle.

Slide 18 of 34

Retroviruses

Retroviruses contain RNA as their genetic information.

When retroviruses infect cells, they make a DNA copy of their RNA.

This DNA is inserted into the DNA of the host cell.

Slide 19 of 34

19–2 Viruses 🗪 Retroviruses

A retrovirus' genetic information is copied backward—from RNA to DNA.

The virus that causes AIDS is a retrovirus.

Slide 20 of 34

Viruses and Living Cells

Viruses must infect a living cell in order to grow and reproduce.

They take advantage of the host's respiration, nutrition, and all other functions of living things.

Slide 21 of 34 Viruses have many of the characteristics of living things.

After infecting living cells, viruses can reproduce, regulate gene expression, and even evolve.

Slide 22 of 34 Because viruses are dependent on living things, it seems likely that viruses developed after living cells.

The first viruses may have evolved from genetic material of living cells.

Viruses have continued to evolve over billions of years.

19-2 Section QUIZ

Copyright Pearson Prentice Hall

Slide 24 of 34

- 1 Viruses that contain RNA as their genetic information are known as
 - a. prions.
 - b. oncoviruses.

c. retroviruses.

d. bacteriophage.

А

Slide 25 of 34 2

A

- The first type of virus to be studied was the
 - a. bacteriophage.
- b. tobacco mosaic virus.
 - c. influenza virus.
 - d. AIDS virus.

Slide 26 of 34

- 3
- Which of the following statements about viruses is true?
 - a. Viruses appear similar to bacteria when studied with a light microscope.
 - b. Viruses display the essential characteristics of living things.
 - c. Viruses can reproduce independently if they contain DNA.

Slide 27 of 34

A d. Viruses cannot reproduce unless they infect a living cell.

- A virus integrates its DNA into the DNA of the host cell but remains inactive for a while in
 - a. a lytic infection.
 - b. a lysogenic infection.
 - c. neither a lytic nor a lysogenic infection.
 - d. retroviral infection.

A

Slide 28 of 34

- 5 Retroviruses are considered unique because
 - a. they have RNA in their capsid and not DNA.
 - b. they have DNA in their capsid and not RNA.
 - c. after infection of a host cell, their RNA makes DNA.
 - d. after infection of a host cell, their DNA makes RNA.

A
