9-2 The Krebs Cycle and Electron Transport

Slide 1 of 37 9-2 The Krebs Cycle and Electron Transport

Oxygen is required for the final steps of cellular respiration.

Because the pathways of cellular respiration require oxygen, they are **aerobic**.

Slide 2 of 37

The Krebs Cycle

In the presence of oxygen, pyruvic acid produced in glycolysis passes to the second stage of cellular respiration, the **Krebs cycle**.

Copyright Pearson Prentice Hall

Slide 3 of 37

What happens during the Krebs cycle?

Copyright Pearson Prentice Hall

Slide 4 of 37

During the Krebs cycle, pyruvic acid is broken down into carbon dioxide in a series of energy-extracting reactions.

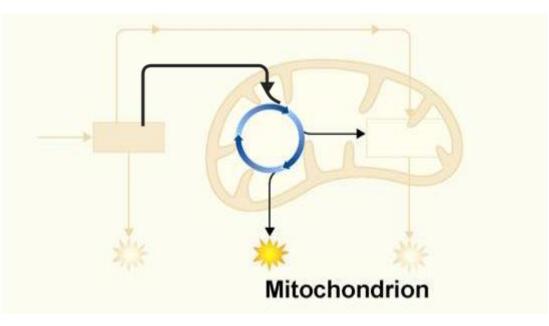

Copyright Pearson Prentice Hall

Slide 5 of 37

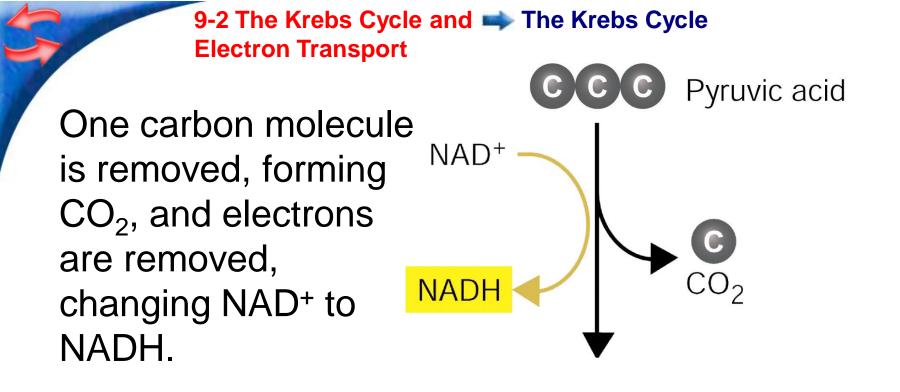

The Krebs cycle begins when pyruvic acid produced by glycolysis enters the mitochondrion.

PEARSON Prentice Hall Citric acid is broken down into a 5-carbon compound, then into a 4-carbon compound.

Slide 10 of 37

Copyright Pearson Prentice Hall

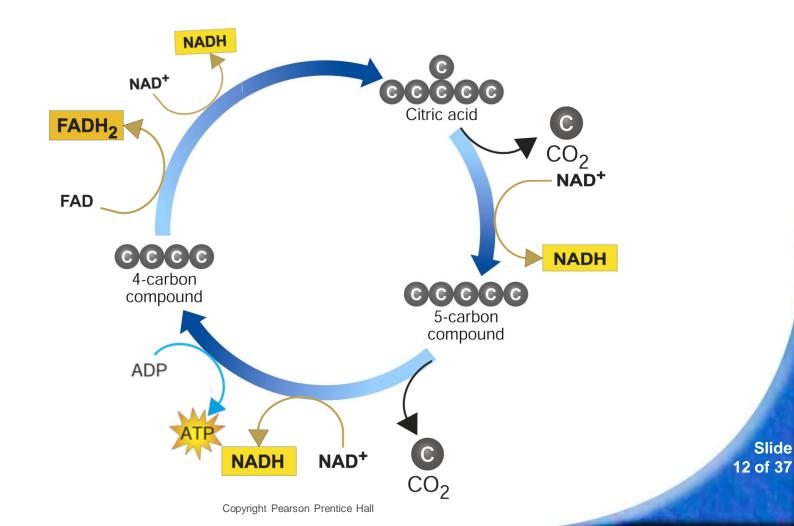

Two more molecules of CO_2 are released and electrons join NAD⁺ and FAD, forming NADH and FADH₂

PEARSON

Prentice Hall

In addition, one molecule of ATP is generated.

The energy tally from 1 molecule of pyruvic acid is

- 4 NADH
- 1 FADH₂
- 1 ATP

Slide 13 of 37

What does the cell do with all those high-energy electrons in carriers like NADH?

In the presence of oxygen, those high-energy electrons can be used to generate huge amounts of ATP.

Slide 14 of 37

How are high-energy electrons used by the electron transport chain?

Copyright Pearson Prentice Hall

Slide 15 of 37

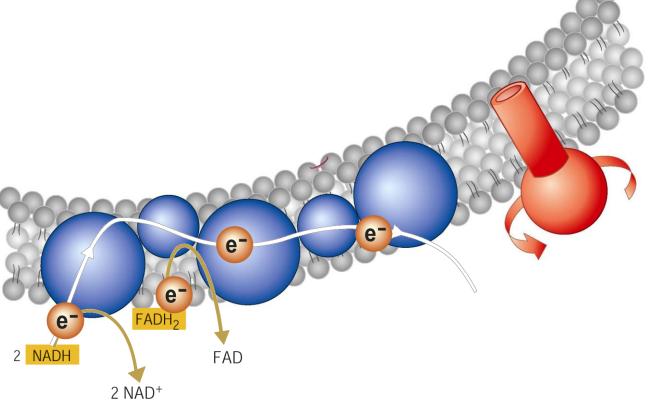

Electron Transport

The electron transport chain uses the highenergy electrons from the Krebs cycle to convert ADP into ATP.

Slide 16 of 37

High-energy electrons from NADH and $FADH_2$ are passed along the electron transport chain from one carrier protein to the next.

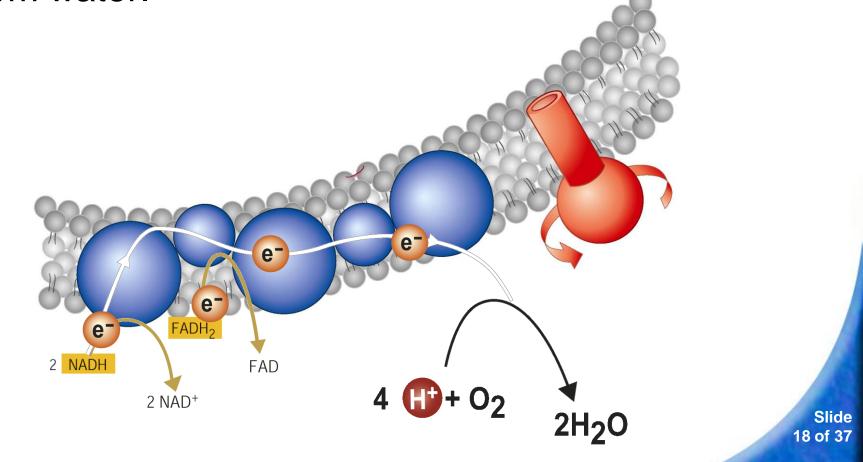

movie

click to start

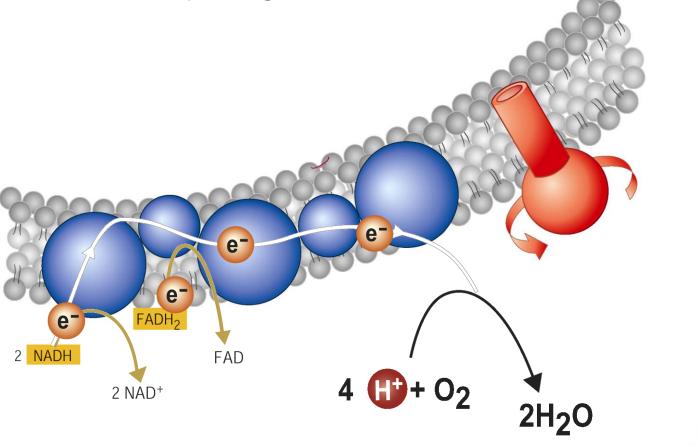

Slide 17 of 37

At the end of the chain, an enzyme combines these electrons with hydrogen ions and oxygen to form water.

PEARSON

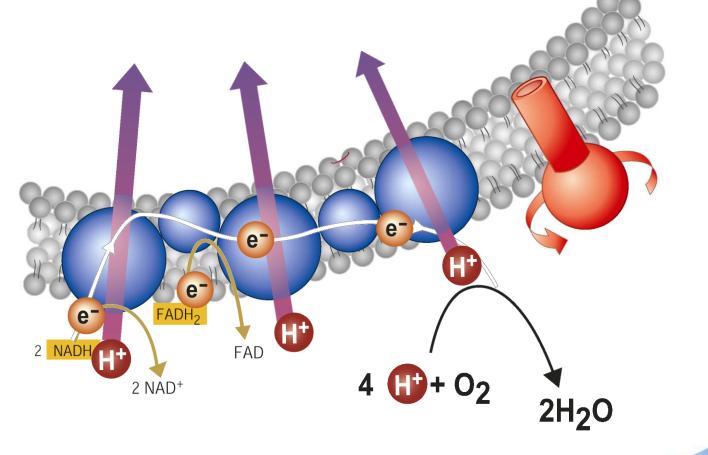

As the final electron acceptor of the electron transport chain, oxygen gets rid of the low-energy electrons and hydrogen ions.

Slide 19 of <u>37</u>

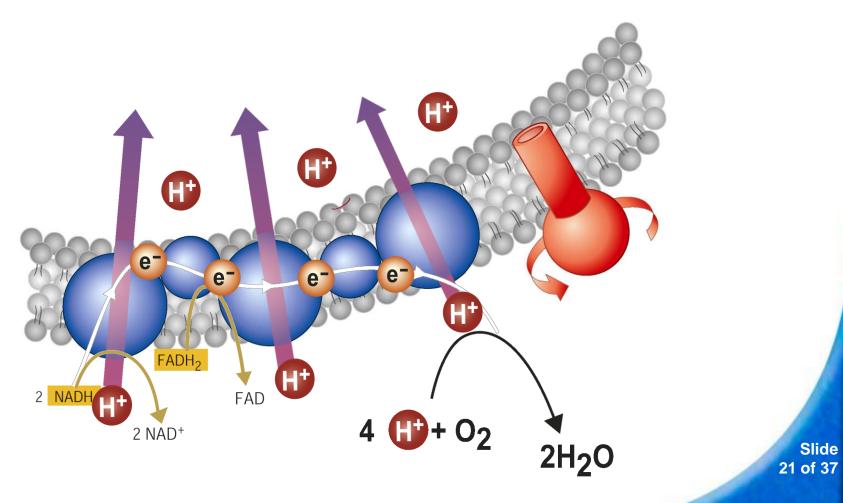

When 2 high-energy electrons move down the electron transport chain, their energy is used to move hydrogen ions (H⁺) across the membrane.

PEARSON Prentice Hall Slide 20 of 37

During electron transport, H⁺ ions build up in the intermembrane space, so it is positively charged.

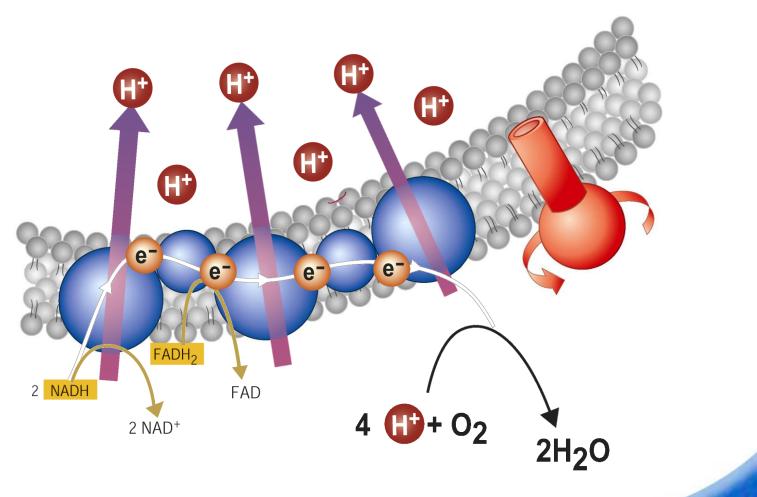

movie

Click to start

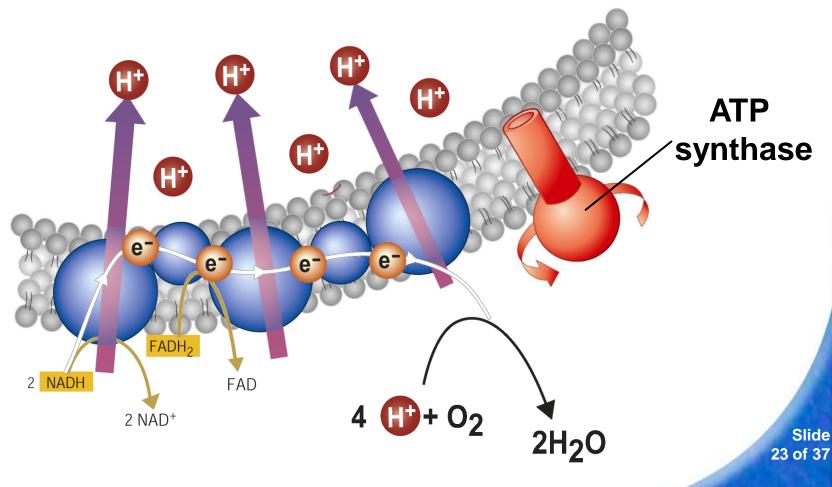

The other side of the membrane, from which those H⁺ ions are taken, is now negatively charged.

Slide 22 of 37

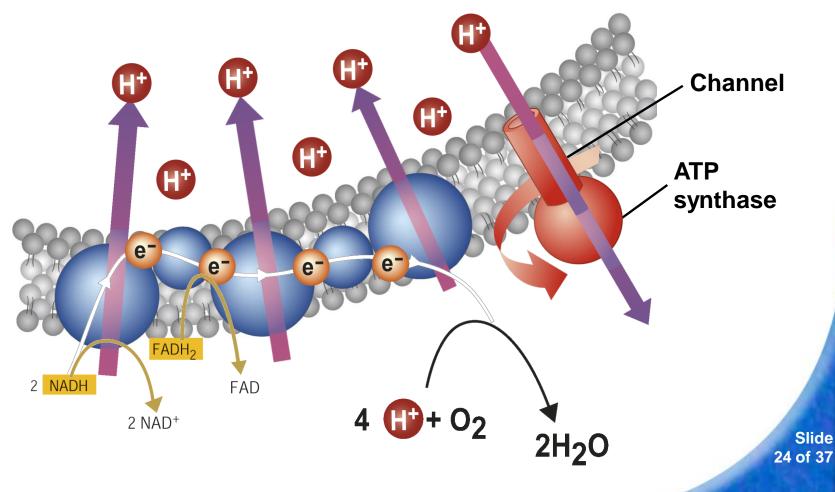

The inner membranes of the mitochondria contain protein spheres called ATP synthases.

PEARSON Prentice Hall

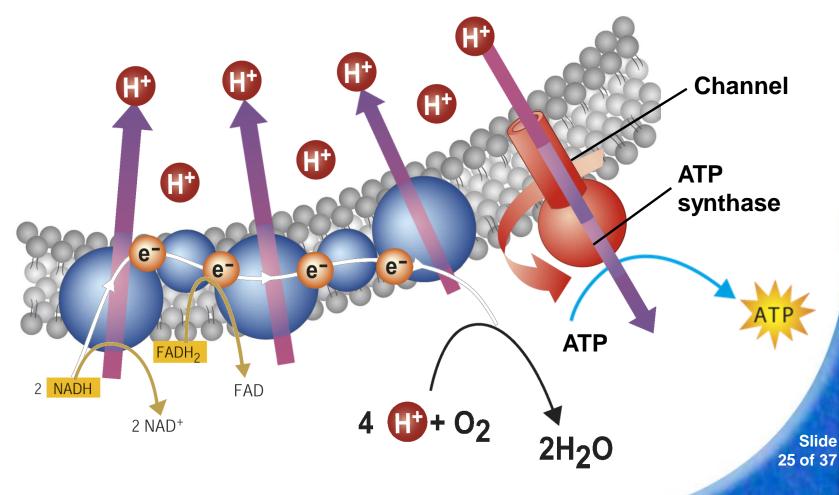

As H⁺ ions escape through channels into these proteins, the ATP synthase spins.

PEARSON Prentice Hall

As it rotates, the enzyme grabs a low-energy ADP, attaching a phosphate, forming high-energy ATP.

On average, each pair of high-energy electrons that moves down the electron transport chain provides enough energy to produce three molecules of ATP from ADP.

Slide 26 of 37 9-2 The Krebs Cycle and The Totals Electron Transport

The Totals

Glycolysis produces just 2 ATP molecules per molecule of glucose.

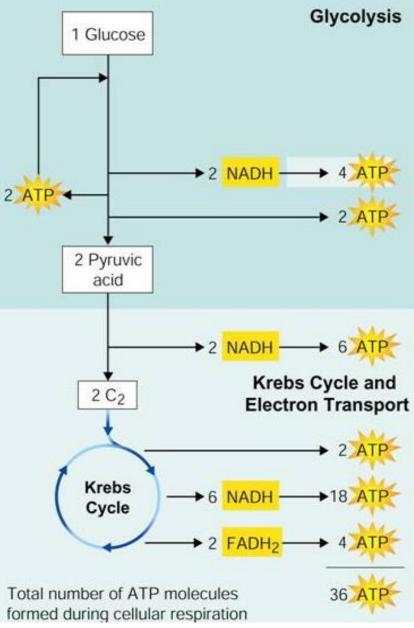

The complete breakdown of glucose through cellular respiration, including glycolysis, results in the production of 36 molecules of ATP.

Slide 28 of 37 **9-2 The Krebs Cycle and** Comparing Photosynthesis and Electron Transport

Comparing Photosynthesis and Cellular Respiration

The energy flows in photosynthesis and cellular respiration take place in opposite directions.

$$6CO_2 + 6H_2O \longrightarrow C_6H_{12}O_6 + 6O_2$$

Energy

$$6O_2 + C_6H_{12}O_6 \rightarrow 6CO_2 + 6H_2O_6$$

Energy

Copyright Pearson Prentice Hall

Slide 29 of 37 9-2 The Krebs Cycle and Comparing Photosynthesis andElectron TransportCellular Respiration

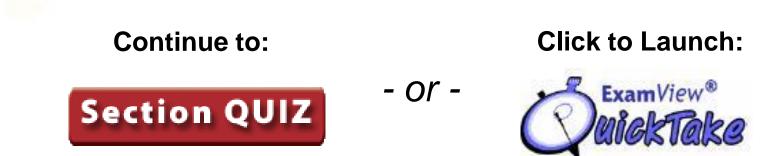

On a global level, photosynthesis and cellular respiration are also opposites.

- Photosynthesis removes carbon dioxide from the atmosphere and cellular respiration puts it back.
- Photosynthesis releases oxygen into the atmosphere and cellular respiration uses that oxygen to release energy from food.

Slide 31 of 37

- 1
- The Krebs cycle breaks pyruvic acid down into
 - a. oxygen.
 - b. NADH.
- A c. carbon dioxide.
 - d. alcohol.

Slide 32 of 37

- 2
 - What role does the Krebs cycle play in the cell?
 - a. It breaks down glucose and releases its stored energy.
- A b. It releases energy from molecules formed during glycolysis.
 - c. It combines carbon dioxide and water into high-energy molecules.
 - d. It breaks down ATP and NADH, releasing stored energy.

Slide 33 of 37

- In eukaryotes, the electron transport chain is located in the
 - a. cell membrane.

b. inner mitochondrial membrane.

c. cytoplasm.

d. outer mitochondrial membrane.

Copyright Pearson Prentice Hall

Slide 34 of 37

- 4 To generate energy over long periods, the body must use
 - a. stored ATP.
 - b. lactic acid fermentation.
 - c. cellular respiration.
 - d. glycolysis.

А

Slide 35 of 37

- 5 Which statement correctly describes photosynthesis and cellular respiration?
 - a. Photosynthesis releases energy, while cellular respiration stores energy.
 - b. Photosynthesis and cellular respiration use the same raw materials.
 - c. Cellular respiration releases energy, while photosynthesis stores energy.
 - d. Cellular respiration and photosynthesis produce the same products.
