35–4 The Senses

There are five general categories of sensory receptors:

- pain receptors
- thermoreceptors
- mechanoreceptors
- chemoreceptors
- photoreceptors

Slide 1 of 49

The retina is the inner layer of eye that contains photoreceptors.

Slide 2 of 49

The choroid is the middle layer of eye that is rich in blood vessels.

Copyright Pearson Prentice Hall

Slide 3 of 49

The sclera is the outer layer of eye that maintains its shape.

The sclera serves as point of attachment for muscles that move the eye.

Slide 4 of 49

Sclera

Light enters the eye through the cornea, a tough transparent layer of cells.

Slide

The cornea helps focus light, which then passes through a chamber filled with a fluid called aqueous humor.

At the back of the chamber is a disklike structure called the iris, which is the colored part of the eye.

In the middle of the iris is a small opening called the pupil. Muscles in the iris adjust pupil size to regulate the amount of light that enters the eye.

Slide 8 of 49

Just behind the iris is the **lens**.

Muscles attached to the lens change its shape to adjust focus to see near or distant objects.

Slide 9 of 49

Behind the lens is a large chamber filled with a transparent, jellylike fluid called vitreous humor.

Slide 10 of 49

The lens focuses light onto the retina.

Photoreceptors are arranged in a layer in the retina.

Copyright Pearson Prentice Hall

Slide 11 of 49 Rods are sensitive to light, but not color.

Cones respond to light of different colors, producing color vision.

Slide 12 of 49

Cones are concentrated in the fovea, which is the site of sharpest vision.

Copyright Pearson Prentice Hall

Slide 13 of 49 The impulses leave each eye by way of the optic nerve. Optic nerves carry impulses to the brain.

The brain interprets them as visual images and provides information about the external world.

Slide 14 of 49 **35–4 The Senses →** Hearing and Balance

The Ear

The human ear has two sensory functions:

- hearing
- balance

Slide 15 of 49 **35–4 The Senses** Hearing and Balance

The Human Ear

Copyright Pearson Prentice Hall

Slide 16 of 49 **35–4 The Senses →** Hearing and Balance

Vibrations enter the ear through the auditory canal.

35–4 The Senses → Hearing and Balance

The vibrations cause the tympanum, or eardrum, to vibrate.

Copyright Pearson Prentice Hall

Slide 18 of 49 **35–4 The Senses** Hearing and Balance

The vibrations are picked up by the hammer, anvil, and stirrup.

Copyright Pearson Prentice Hall

Slide 19 of 49 **35–4 The Senses →** Hearing and Balance

The stirrup transmits the vibrations to the oval window.

Slide 20 of 49

35–4 The Senses Hearing and Balance

Vibrations of the oval window create pressure waves in the fluid-filled **cochlea** of the inner ear.

35–4 The Senses → Hearing and Balance

Within the inner ear, just above the cochlea are three **semicircular canals**.

35-4 Section QUIZ

Copyright Pearson Prentice Hall

Slide 23 of 49 1

The sensory receptor that detects variations in body temperature is a

a. chemoreceptor.

b. mechanoreceptor.

c. thermoreceptor.

d. photoreceptor.

Slide 24 of 49 2

The part of the eye containing tiny muscles that adjust the size of the pupil is the

a. cornea.

- c. lens.
- d. retina.

Slide 25 of 49

- 3
- The part of the ear that produces the nerve impulses sent to the brain is the
 - a. tympanum.
 - b. Eustachian tube.

c. cochlea.

d. oval window.

Slide 26 of 49

- 4
- The structures in your ears that help maintain your sense of balance
 - a. is the auditory canal.
 - b. is the hammer.
 - c. is the tympanum.

A d. are the semicircular canals.

Slide 27 of 49 5

A

Photoreceptors in the eye that are sensitive to color are

a. rods.

b. cones.

- c. rods and cones.
- d. the optic nerve.
